

About SunOne Solutions

SunOne Solutions is a leader in developing agricultural, land management, and environmental projects for registration and trading on carbon exchange markets. SunOne's primary focus is on carbon sequestration projects on forestland, farmland, and rangeland with offices in California, Colorado, Nebraska, Texas, and Brazil. To date, SunOne has successfully developed over 150 projects on over 2.2 million acres of land for over 3 million carbon "offset" credits. SunOne was named the #1 carbon aggregator in North America by Point Carbon, a top industry publication.

Opportunities for Farmers, Ranchers, and Forestland Owners

The following types of sustainably-managed land may be eligible for carbon "offset" credits:

- Forestland and Grassland that is under threat of development into agriculture, commercial, or residential use and is placed in permanent conservation status
- Forestland that is sustainably managed, or undergoing afforestation/reforestation
- Farmland introducing precision fertilizer applications or other conservation practices
- Rangeland that is degraded and being rehabilitated or receiving other sustainable practices that increase forage balance and soil organic carbon

SunOne Solutions' carbon offset services are designed to minimize economic risk to landowners/managers. We earn our commission (paid in offsets, not cash) by helping them through the process and covering the costs to verify the sustainable practices on their land. Our team takes our landowning/managing customers through the registration process and explains in detail the benefits of registering land in order to earn credits. The potential value of registering land depends on several factors, especially the market price of carbon. We therefore also work directly with our clients on the sales side to help them realize maximum value for their credits through our network of corporate and industrial buyers.

SunOne Solutions is unique in the industry in that we do not require any out-of-pocket expenses from our customers.

SunOne Solutions works in partnership with landowners/managers to earn additional revenue through a commitment to sustainable land management practices. Our team of professionals has several decades of combined experience in the agricultural, banking, finance, energy, environmental science, and public policy sectors and can assist the clients we partner with to:

1. Review the eligibility, carbon potential, and economic value of enrolling in a carbon program
2. Develop the necessary maps, records, and plans to apply for carbon credits
3. Perform carbon inventory and growth analysis over the life of the project
4. Design a monitoring plan and manage the third party verification process
5. Register the project on a formal exchange or directly with large, credit-worthy buyers
6. Receive the best value for your carbon credits either as an annuity or by pre-selling future offsets
